

End of Life Product Disposal

Ellis products are uniquely identified on the packaging and / or individual products to allow full traceability. Where serial / batch numbers are available please contact Ellis Patents for detailed instructions on product disposal.

General product disposal guidance is given below.

Ellis products are categorised as:-

- Metallic
- Polymer
- Composite (a combination of metallic and polymer components)

Metallic

Ellis manufacture products in Stainless Steel, Steel and Aluminium, which are all readily recyclable.

Polymer

Ellis use a range of polymers including Polyamides (PA), Polypropylenes (PP), and Thermoplastic Elastomers (TPEs), many of which are recyclable. Where recycling information is not available on the product please contact our customer service team for further guidance.

Composite products

Where possible products should be disassembled and segregated into individual components / material types to enable effective recycling. If this is not possible products should be treated as mixed waste and disposed of accordingly with general waste.

For further guidance please contact our customer service team.
